

## **CHAPTER 1. GENERAL POLICY STATEMENT AND INTRODUCTION**

The Pelican River Watershed District (the “District”) is a political subdivision of the State of Minnesota, established under Minn. Stat. Chapter 103D, cited as the “Watershed Law.” Under the Watershed Law, the District exercises a series of powers to accomplish its statutory purposes. Under Chapter 103D the District’s general statutory purpose is to conserve natural resources through development planning, sediment and erosion control, and other conservation projects, based upon sound scientific principles. In order to accomplish its statutory purpose, the governing body of the District, the Board of Managers, is required to adopt a series of rules, cited as the 2024 Revised Rules of the PRWD (the “Rules”).

The District, as part of the Otter Tail River One Watershed One Plan process, has adopted a Comprehensive Watershed Management Plan (the “Plan”), which contains the framework and guiding principles for the District in carrying out its statutory purposes. It is the District’s intent to implement the Plan’s principles and objectives in the Rules.

Land alteration affects the volume, and quality of surface water runoff which ultimately must be accommodated by the existing surface water systems within the District. The District was established in 1966 in response to concerns about regional lake health. Lake health and contributing factors continue to be the primary focus of the District.

Land alteration and utilization also can degrade the quality of runoff entering the streams and waterbodies of the District due to non-point source pollution. Lake and stream sedimentation from ongoing erosion processes and construction activities reduces the hydraulic capacity of waterbodies and degrades water quality. Water quality problems already exist in many of the lakes and streams throughout the District.

Projects which increase the rate or volume of stormwater runoff can decrease downstream hydraulic capacity. Projects which degrade runoff quality can aggravate existing water quality problems and contribute to new ones. Projects which fill floodplain or wetland areas can aggravate existing flooding by reducing flood storage and hydraulic capacity of waterbodies and can degrade water quality by eliminating the filtering capacity of those areas.

Under the Rules, the District seeks to protect the public health and welfare and the natural resources of the District by providing reasonable regulation of the modification or alteration of the District’s lands and waters to reduce the severity and frequency of flooding and high water; to preserve floodplain and wetland storage capacity; to improve the chemical, physical, and biological quality of surface water; to reduce sedimentation; to preserve waterbodies’ hydraulic and navigational capacity; to preserve natural wetland and shoreland features; and to minimize public expenditures to avoid or correct these problems in the future.
